

EDGE™

BALLISTIC-RATED
EYEWEAR

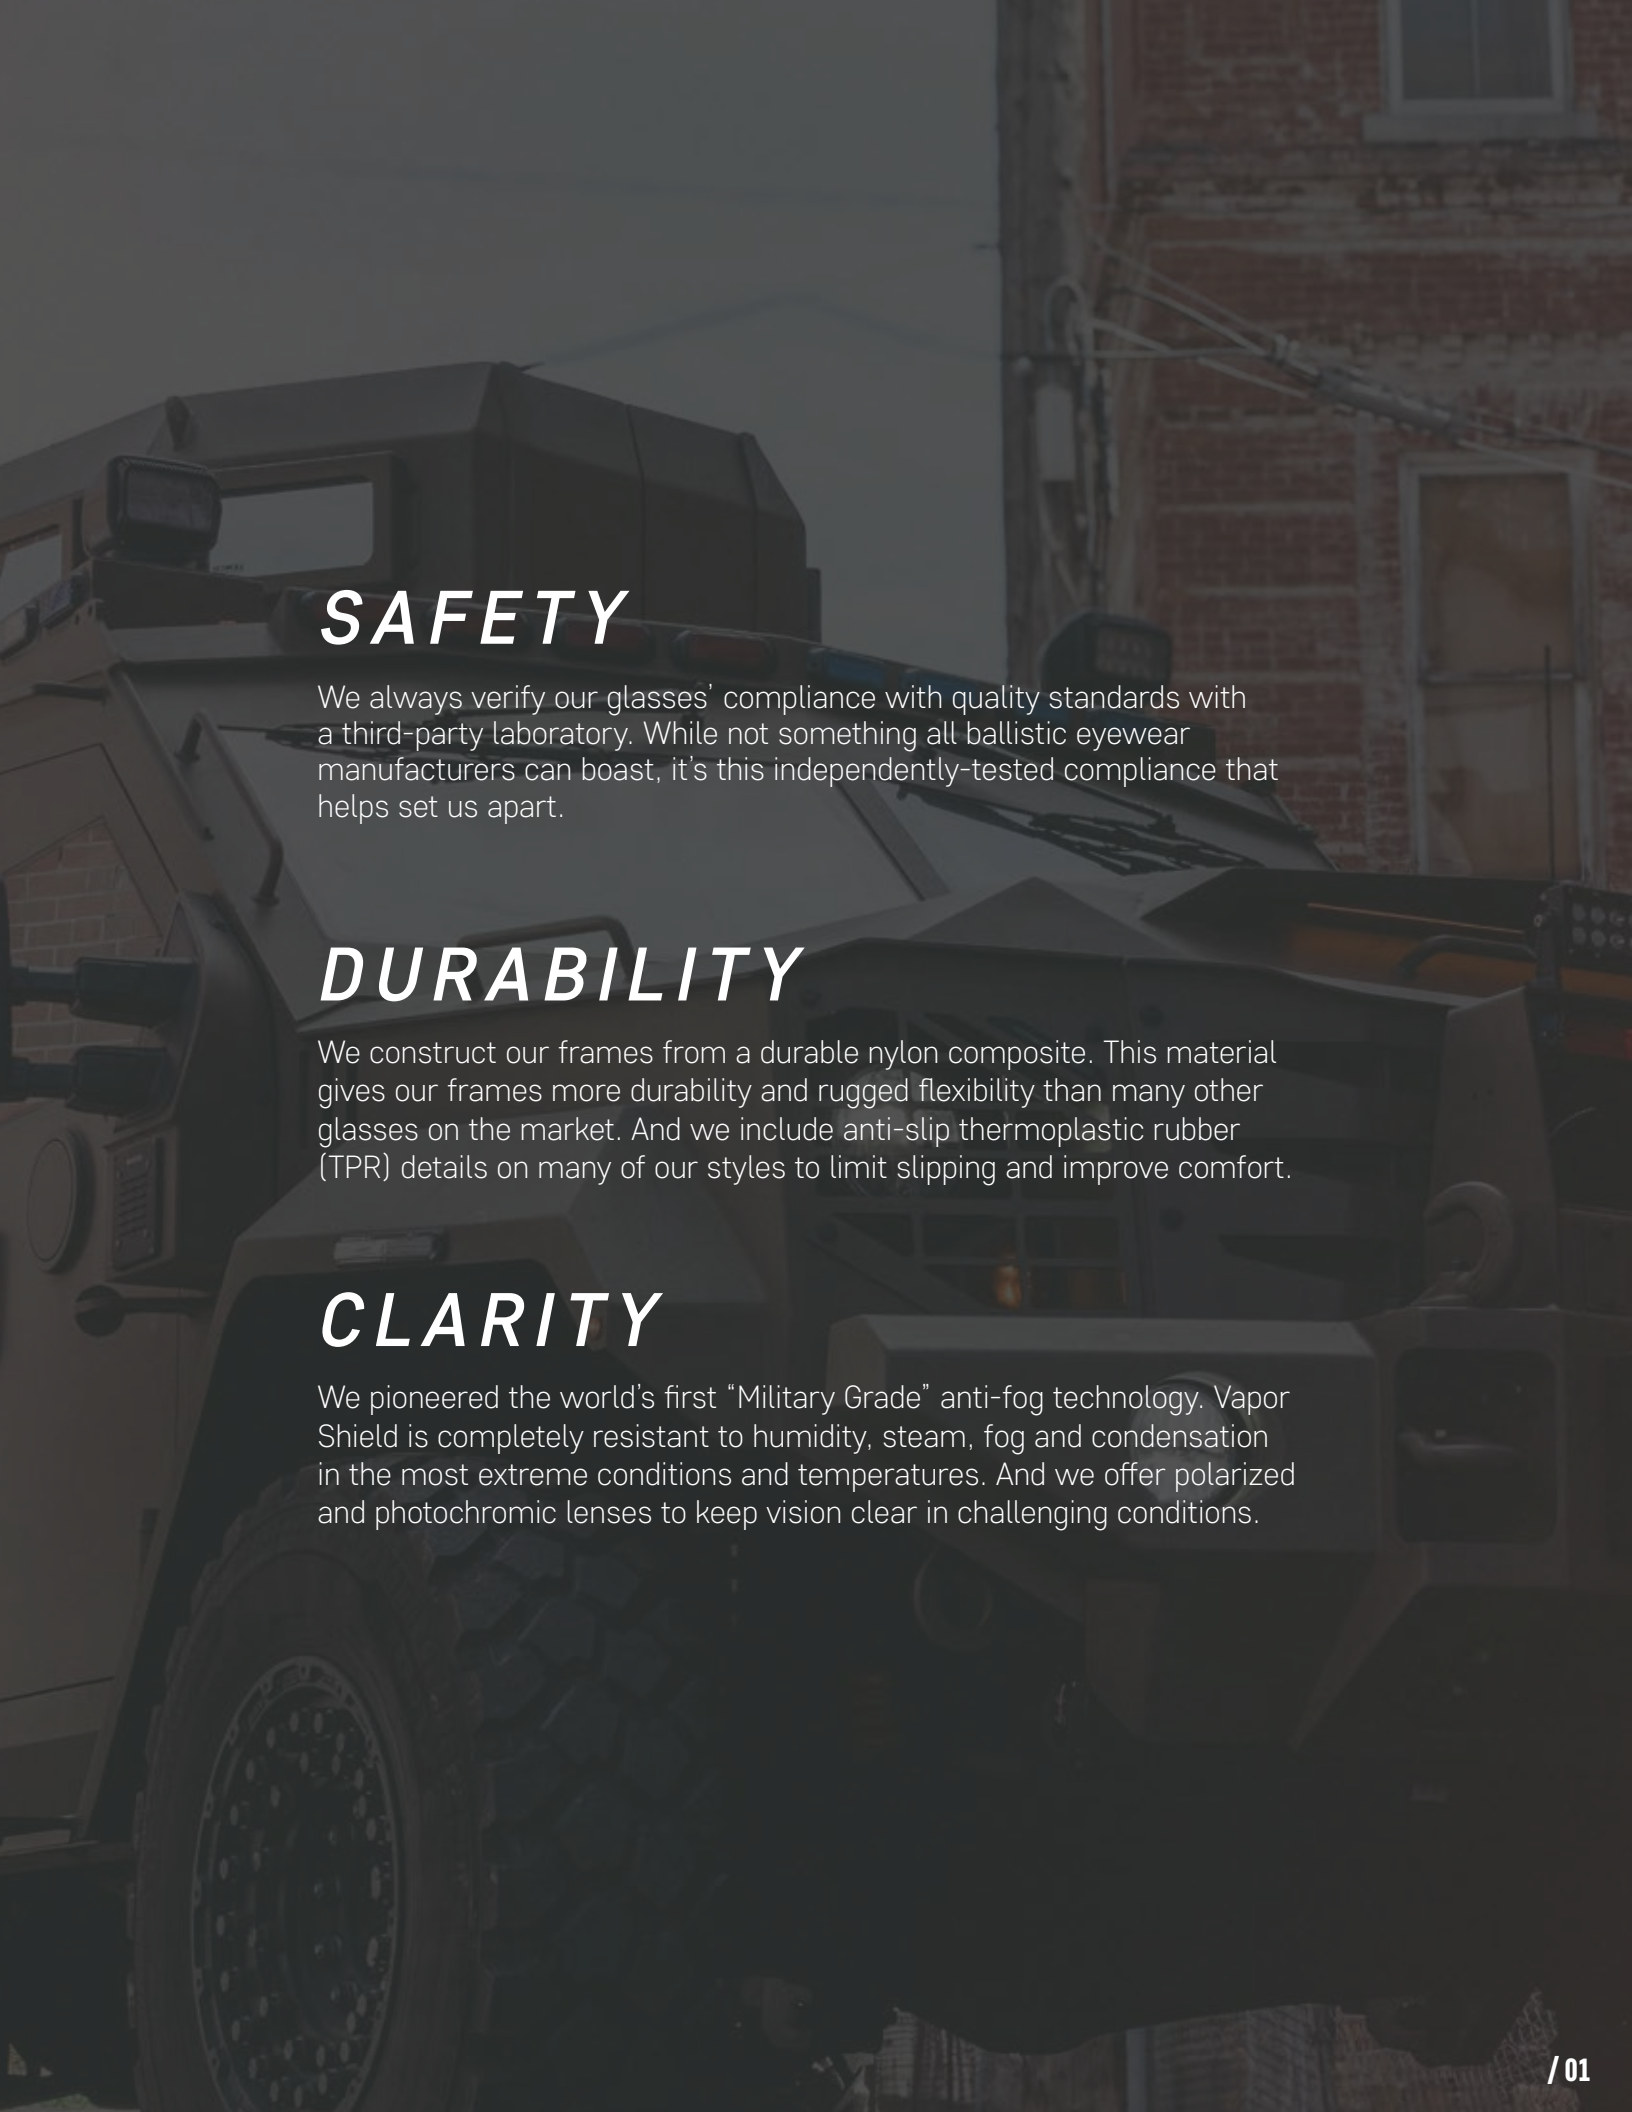

TACTICAL | 26.1

BUILT FOR MORE

Edge was born out of the necessity for delivering advanced safety glasses to a market underserved by the options available at the time. We set out to design safety-rated eyewear that was stylish, comfortable, and packed with technology. We disrupted the eyewear industry with products Built for More Safety, Durability, and Clarity.

Then we did it all over again for the tactical industry.

Our obsession is offering ballistic eye pro with comfort-forward frame features, advanced lens technologies and independently-certified MIL-SPEC standards compliance. We've researched the needs of modern law enforcement officers/military personnel and refined our products to fit, perform and complement the entire protective kit. Our frame styles match with helmets or hearing protection and we offer lenses for virtually any condition. Delivering tactical styles Built for More Safety, Durability and Clarity is our mission.

SAFETY

We always verify our glasses' compliance with quality standards with a third-party laboratory. While not something all ballistic eyewear manufacturers can boast, it's this independently-tested compliance that helps set us apart.

DURABILITY

We construct our frames from a durable nylon composite. This material gives our frames more durability and rugged flexibility than many other glasses on the market. And we include anti-slip thermoplastic rubber (TPR) details on many of our styles to limit slipping and improve comfort.

CLARITY

We pioneered the world's first "Military Grade" anti-fog technology. Vapor Shield is completely resistant to humidity, steam, fog and condensation in the most extreme conditions and temperatures. And we offer polarized and photochromic lenses to keep vision clear in challenging conditions.

PRODUCT **TIER S**

We've categorized our collection of tactical glasses into four tiers based on the product selection's available technologies, cost and intended user. Use this tiered system to select the Edge frame styles best suited to your case and budget.

TIER 1

\$90-\$110 MSRP

Our finest tactical glasses are designed for special forces and swat teams, with technology and comfort-improving features for changing environments.

TIER 2

\$50-\$75 MSRP

These glasses represent a modern take on dependable frame styles, built to the specifications and requirements of professional soldiers and law enforcement officers.

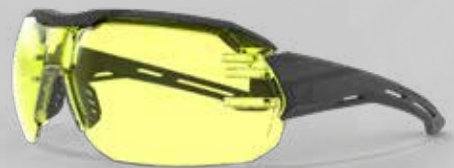

TIER 3

\$25-\$45 MSRP

An economical solution for standard issue tactical glasses, without sacrificing features, comfort, style, or technology.

TIER 4

\$12-\$18 MSRP

An affordable take on gun range and tactical training eyewear, built with materials that promote long-term use and durability.

SAFETY **STANDARDS**

Our tactical collection is rated and compliant to various worldwide standards for ultimate protection against extreme threats.

ANSI Z87.1

ANSI Z87.1+ is the American National Standard Institute's most current safety rating. The most common set of accepted Safety Standards on job sites, manufacturing, and industrial facilities is the "High Impact" (indicated by a + symbol) version of ANSI/ISEA Z87.1. The standard requires very thorough testing in the Optical Clarity, Impact Resistance, and the Coverage aspects of safety eyewear.

CSA Z94.3

CSA Z94.3 is a regulatory standard created by the Canadian Standard Association (CSA) for eye protection. This standard is promoted by the Canadian Centre for Occupational Health and Safety (CCOHS), which functions as the primary national agency for the advancement of safe workplaces and preventing work-related injury. Additional work in this area is carried out by provincial and territorial labor departments and workers' compensation boards.

MIL - PRF

Often nicknamed "the ballistic standard", MIL-PRF 32432A testing requires eye pro to withstand impact velocities from a 22-caliber projectile traveling more than 660 ft/s (200 m/s). These tactical glasses are subject to similar testing as the ANSI Z87.1+ safety standard, but with much higher impact velocities. Additionally, the lenses of MIL-PRF 32432A-rated eyewear must maintain pristine optics, including limited fogging.

EN 166

The European standard for eye protection, EN166 provides manufacturers with the minimum requirements for impact resistance, field of vision, optical transmission and other testing protocols. Eyewear marked with the EN166 standard are proven durable and effective at limiting risks to eyesight. All safety eyewear manufacturers are required to have their products independently tested against this standard to be sold in Europe.

UKCA

The UKCA mark is required for products sold in Great Britain (England, Scotland, and Wales). The UKCA mark covers most products that previously required the CE mark. To use the UK (UKCA) mark, manufacturers must have products evaluated for compliance with the technical standards issued for each product category under UK rules. To receive a UKCA mark, the manufacturer placing the product onto the market must submit a technical file containing the same information as they would for a CE marking. The UKCA requirements for Personal Protective Equipment, including safety eyewear, ensure only quality and safe products are offered to the UK market.

STANAG*

The NATO Standardization Agreement (STANAG) is a set of standards that are used by the member countries of the North Atlantic Treaty Organization (NATO) for military procedures and equipment. Testing procedures for STANAG-rated eyewear require protection from fragments, shrapnel, and other eye hazards.

* STANAG-compliant Edge styles will be available in early 2025.

LENS *TECH*

VAPOR SHIELD

The world's first "Military Grade" Anti-Fog which is completely resistant to humidity, steam, fog and condensation in the most extreme conditions and temperatures. The result? Clear, pristine vision.

POLARIZED

Polarized technology can be compared to horizontal blinds where slats create a filtering layer that blocks glare from above and reflected light from below, allowing only direct light rays to enter. This reduced glare is ideal for environments with bright sun, snow, water, or sand.

LASER LENS

Orange tint laser lenses provide protection against flash blinding green lasers. These lenses can be used for protection against lasers between 400-532nm OD3; 1064NM OD3 with VLT 50%.

PHOTOCHROMIC

If you work in environments with changing light, our photochromic lenses can simplify your eye protection requirements. These lenses transition when exposed to UV rays. At their lightest state, they allow 87% of light to pass through, but in their darkened state, the lenses only allow 22% of light to pass through.

G-15

By maximizing transmission of yellow and green light in the middle of the light spectrum, these lenses reduce eye strain and create a cooling sensation to the eyes. G-15 is perfect for a variety of bright light conditions and maintaining true-to life color perception.

BLUE LIGHT

Blue light has short wavelengths, which cause the eye to focus too far in front of the retina. The result is a blue blur that can cause eyestrain. Tiger's Eye, Copper, and yellow colored lenses reduce blue light to give greater depth perception and brighter, defined surroundings.

FRAME *TECH*

MULTI-FIT

With an adjustable TPR nosepiece, a perfect fit can be achieved for a variety of facial structures by bending each flexible nosepad together, apart, forward, or backward.

OVER THE GLASS

For those who need corrective eyewear, our fit-over tactical goggles fit over most RX glasses. Plus, the thermoplastic rubber (TPR) gasket included with our fit-over style keeps airborne debris and other hazards out.

THIN TEMPLES

Thin temple technology helps our ballistic eyewear slide more comfortably under hearing protection and helmets. By reducing bulk from the cross-section of the temples, thin temple-equipped frame styles integrate more comfortably with ear pro to reduce temple head pressure.

EDGE-FLEX™

Frames that feature Edge-Flex™ offer a tailored, custom-like fit. This technology employs a floating thermoplastic rubber (TPR) element in the temples that provides comfort-improving flexibility. Edge-Flex™ can stop pinching behind the ears of some other glasses, while simultaneously limiting slipping and reducing overall weight.

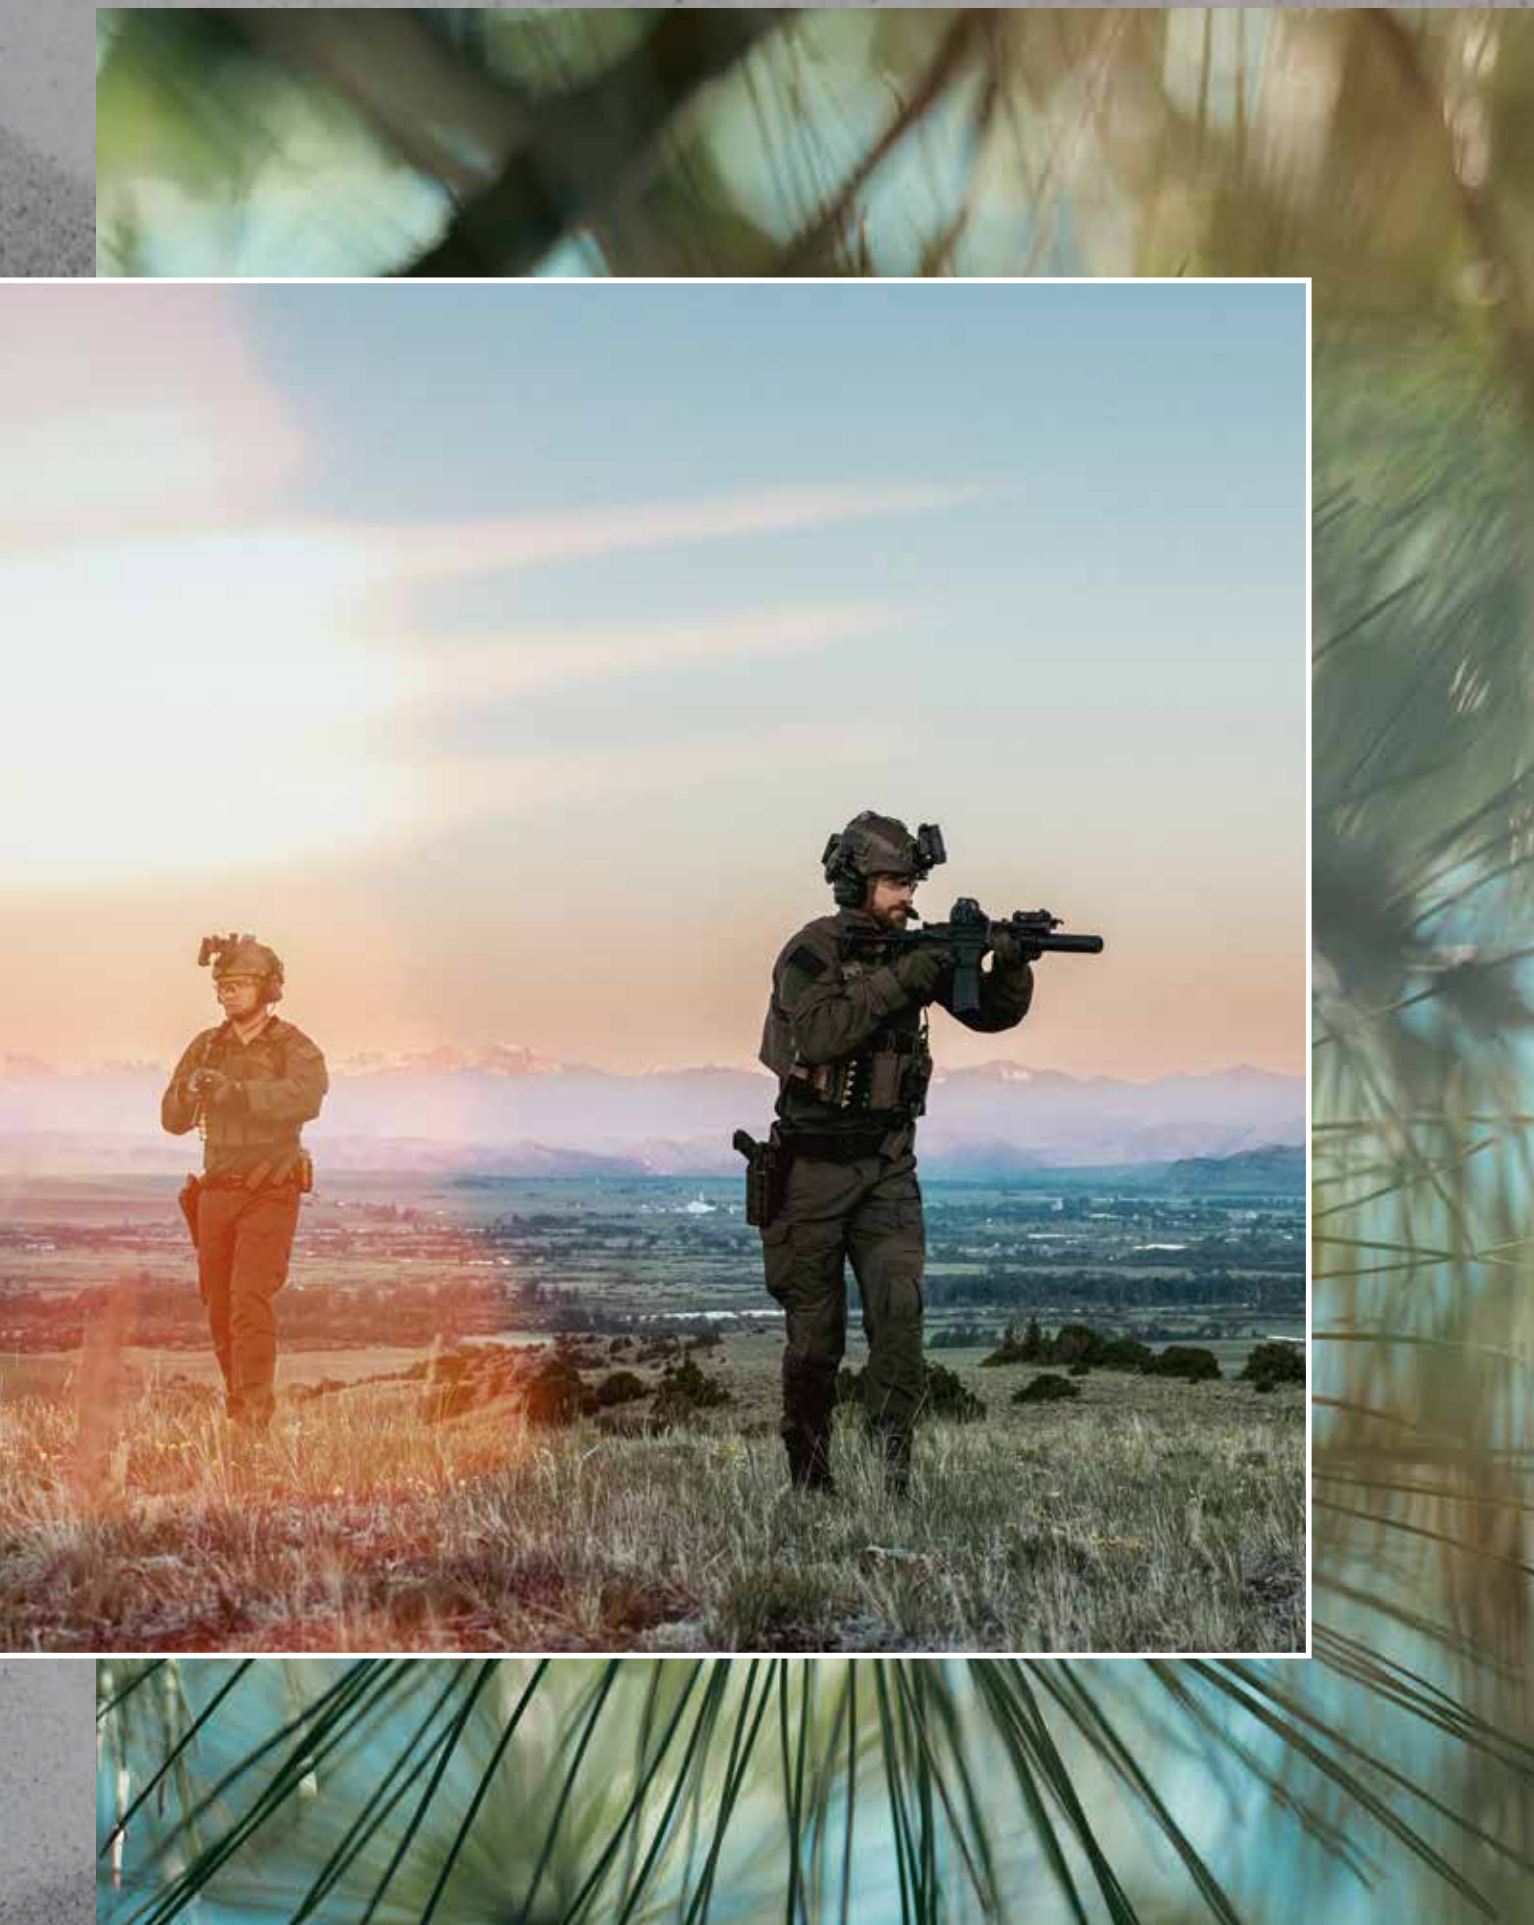

US Patent: 7,452,071B2

UPLC COMPATIBLE

Our Urgent Fury, Overlord G2 and Rolling Thunder frame styles are compatible with our UPLC RX inserts (see page 24 for RX insert). These devices allow for a prescription carrier to be added inside of the frame for a secure fit, sure vision and ultimate protection.

LENS TRANSMISSION

EDGE EYEWEAR LENSES PROVIDE 99.9% UVA, UVB, UVC PROTECTION

CLEAR

85%

LIGHT TRANSMISSION

Clear lenses are a classic option for the tactical industry. With pristine clarity, they are an excellent choice for indoor and low-light conditions.

 Indoor, Low Light Conditions

HI-CONTRAST YELLOW

85%

LIGHT TRANSMISSION

A common lens for gun range and shooting competition use, Hi-Contrast yellow lenses can reduce haze and sharpen perceived images by filtering blue light. Hi-Contrast yellow lenses improve contrast and depth perception.

 Indoor, Low Light Conditions  Cloudy Conditions

TIGER'S EYE

55%

LIGHT TRANSMISSION

Tiger's Eye make outdoor conditions appear sharper by filtering high levels of blue light to allow for greater depth perception and a brighter view of surroundings.

 Partly Cloudy Conditions  Hazy Conditions
 Cloudy Conditions

POLARIZED SMOKE

14%

LIGHT TRANSMISSION

Polarized smoke lenses provide the perfect all-around tint for bright conditions. This lens color blocks sun rays without causing color distortion. The polarizing filter increases clarity by reducing glare.

 Desert, Reflective Conditions  Bright, Clear Conditions
 Water, Reflective Conditions  Partly Cloudy Conditions

COPPER

8%

LIGHT TRANSMISSION

Copper lenses make outdoor conditions appear sharper by filtering high levels of blue light. Copper also increases depth perception and contrast, making it the ideal tint for daytime driving.

 Partly Cloudy Conditions  Hazy Conditions
 Bright, Clear Conditions

FOR GREEN LASERS ORANGE

50%

LIGHT TRANSMISSION

Used to provide protection from green lasers - 400-532nm OD3; 1064nm OD3.

 Lasers

G-15

12%

LIGHT TRANSMISSION

G-15 lenses are perfect for maximizing transmissions of green and yellow light and providing a true to life color perception. This results in reduced strain and a cooling sensation to the eyes.

 Bright, Clear Conditions

PHOTOCHROMIC

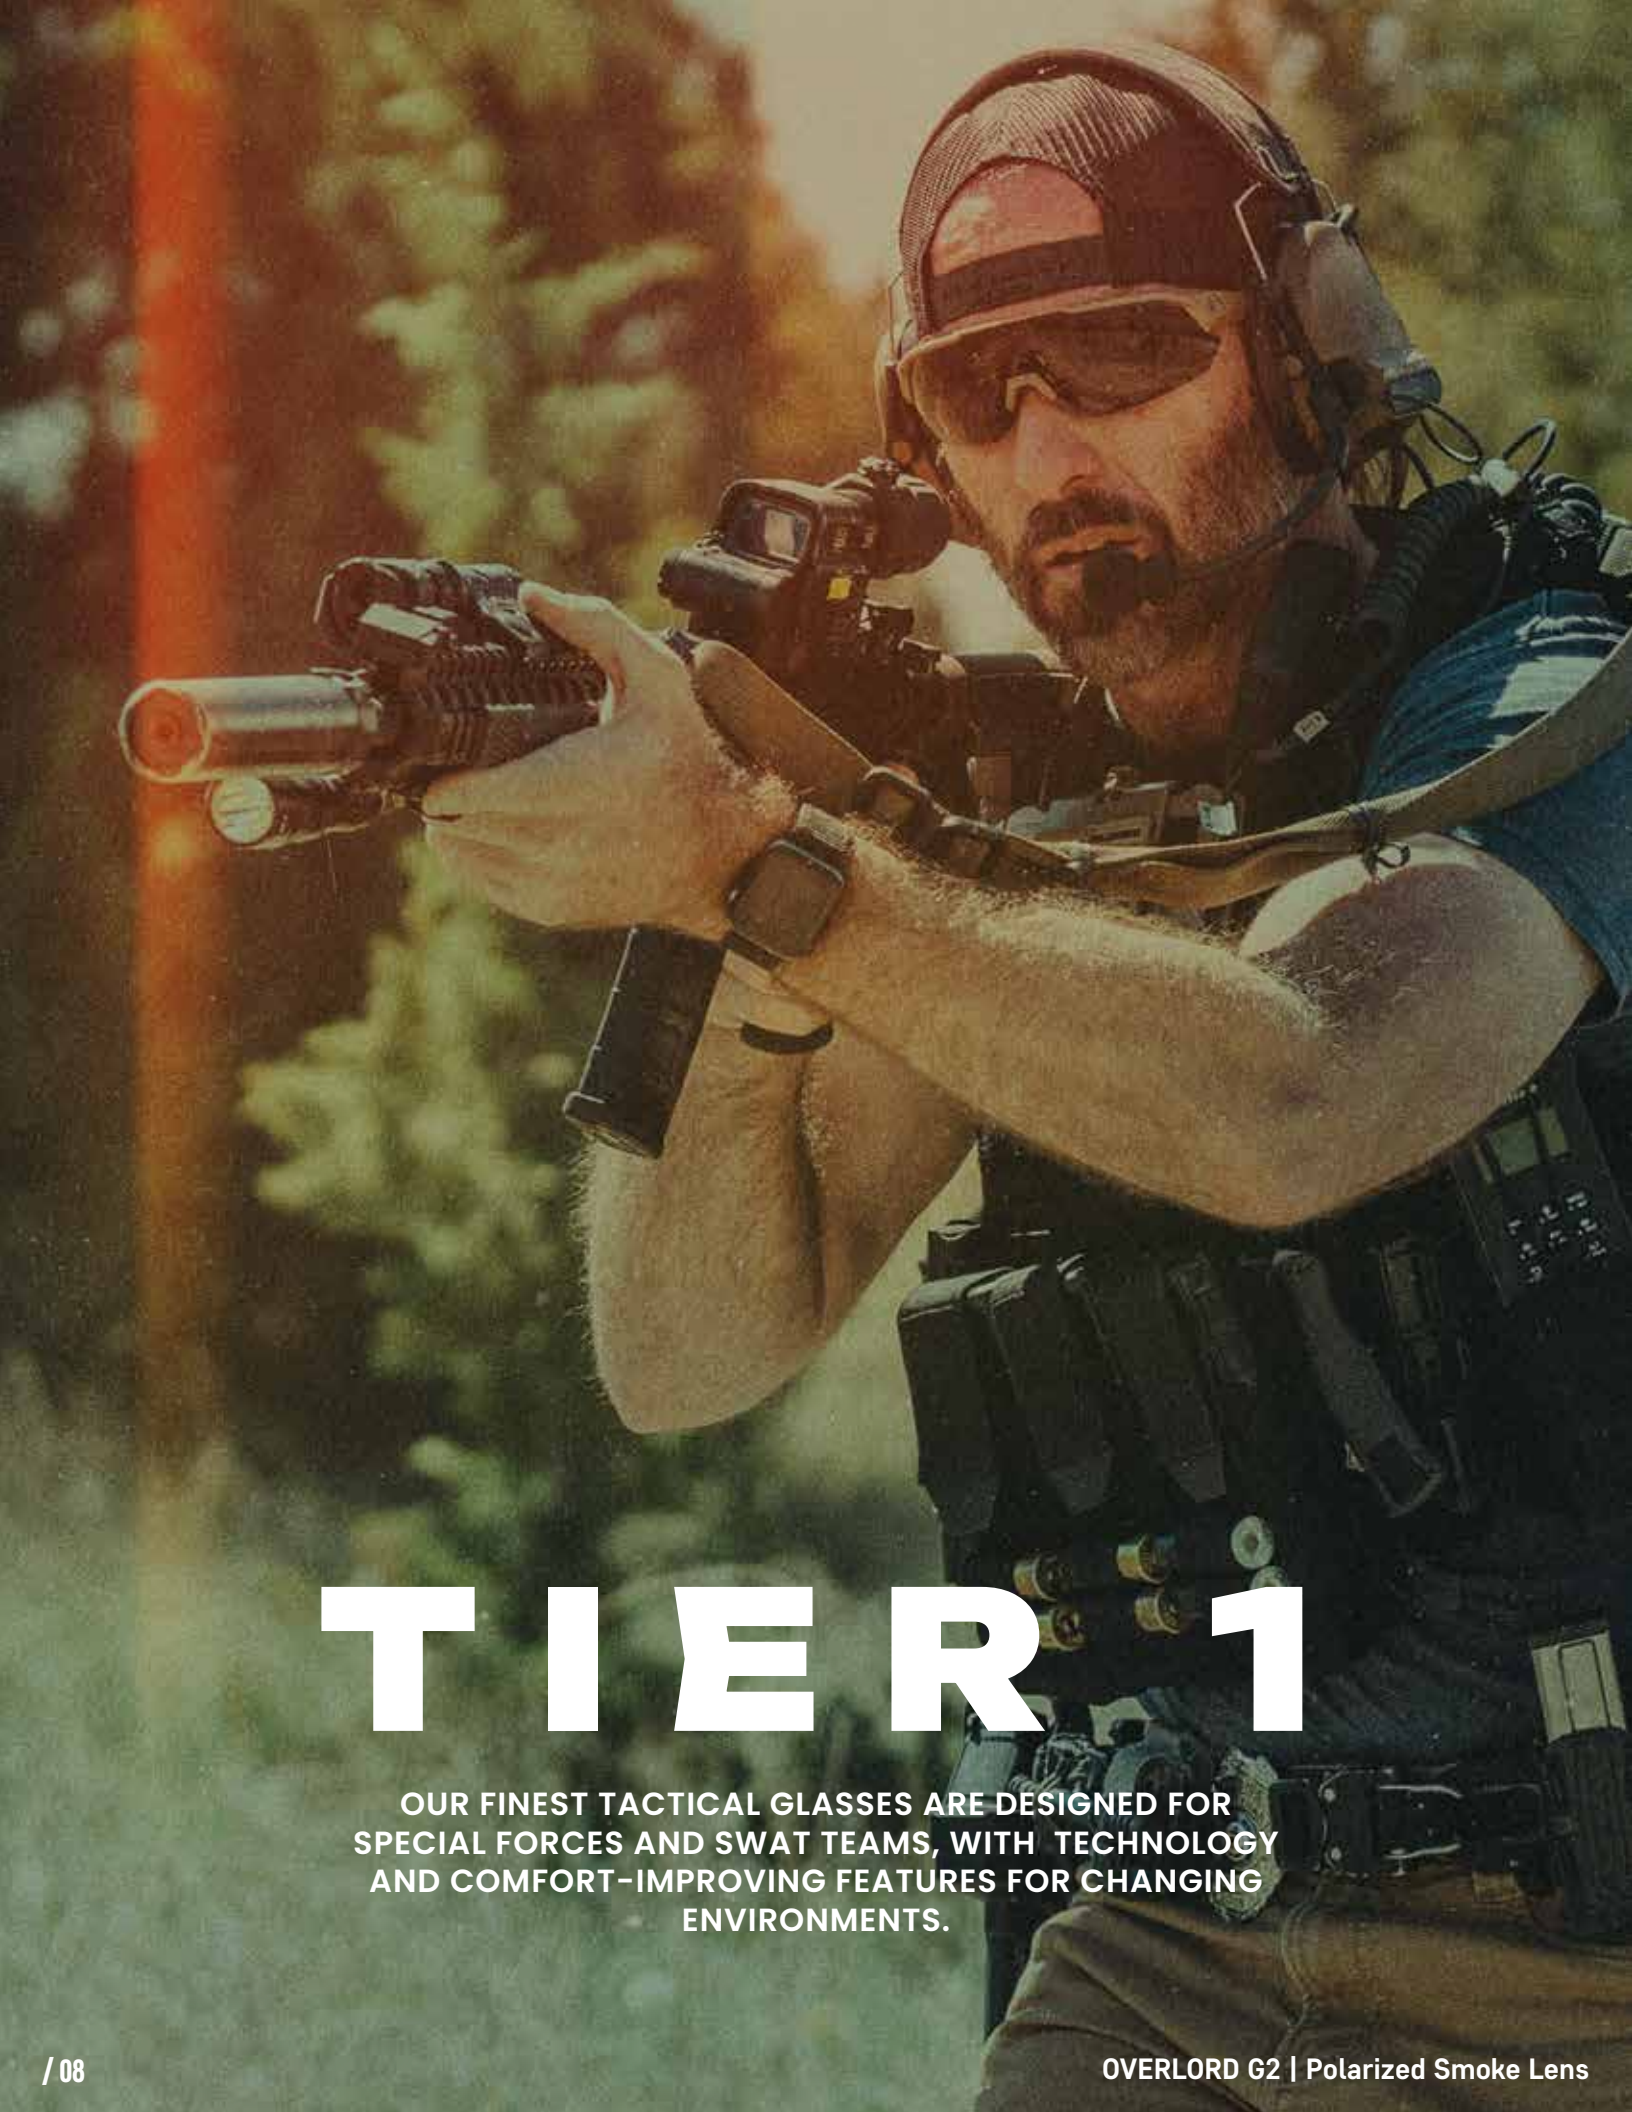

22%-87%

LIGHT TRANSMISSION

These lenses transition when exposed to UV rays. At their lightest state, they allow 87% of light to pass through, but in their darkened state, the lenses only allow 22% of light to pass through.
